Publishing & sharing in tableau

1.What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?

- The key difference between Tableau Public and Tableau Server/Cloud is accessibility and data security.

Feature	Tableau Public	Tableau Server/Cloud
Accessibility	Dashboards are publicly accessible to anyone on the internet.	Dashboards can be shared privately with authorized users.
Data security	Published visualizations are public, so it is unsuitable for confidential business data.	Provides authentication, permissions, and access controls to protect sensitive data.
Best use	Portfolios, educational projects, and public data visualization.	Business reports, internal dashboards, and confidential organizational data.

- In short: Tableau Public is designed for sharing dashboards with the world, whereas Tableau Server/Cloud is designed for secure sharing within an organization or with selected users.
- 
- Tableau
- +1
- Example: A student can publish a portfolio dashboard on Tableau Public, but a company should publish a dashboard containing confidential sales or customer information on Tableau Server/Cloud with appropriate access permissions.

2.When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

- When publishing a Tableau dashboard, a Live Connection and an Extract differ in how they access, update, and process data.

Publishing & sharing in tableau

Feature	Live Connection	Extract
Data access	Connects directly to the original data source.	Uses a saved snapshot of the data.
Data refresh	Displays current data by querying the source whenever needed.	Data must be refreshed periodically or on a schedule.
Performance	May be slower if the source database or network is slow.	Often faster because data is stored in an optimized format.
Internet/database dependency	Requires access to the live data source.	Can work without repeatedly querying the original source.
Best use	Dashboards requiring up-to-date information.	Dashboards requiring fast performance and stable reporting.

Example:

- Live Connection: A sales dashboard queries the company's database to show the latest sales figures.
- Extract: A sales dashboard uses a saved copy of sales data that updates when the extract refreshes.

3.In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

- The feature is called Permissions (Access Control) in Tableau Server or Tableau Cloud.

Administrators use permissions to control which users can view, interact with, or edit a published dashboard.

Example:

- Viewer: Can view and interact with the dashboard.

- Explorer: Can explore data and perform permitted analysis.
- Creator: Can create and edit workbooks, subject to assigned permissions.

In short: Permissions help ensure that only authorized users can access or modify published dashboards.

4.If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

- You would adjust the Download Data permission in Tableau Server.
- This permission controls whether users can download data from a published view. To let users view the dashboard without downloading its underlying data, deny the Download Data permission for those users or groups.
- Example: Employees can view a sales dashboard, but they cannot download the underlying sales data.
- In short: Disable Download Data in the dashboard's permissions settings to help protect the underlying data.

5.Name two methods by which a Tableau dashboard can be embedded into a web page or website

- Two methods to embed a Tableau dashboard into a web page or website are:

1. Embed Code: Copy the HTML embed code provided by Tableau and paste it into the website's HTML.
2. JavaScript API: Use Tableau's Embedding API to embed the dashboard and customize its behavior and interactivity.

In short: Embed Code is a simple way to display a dashboard, while the JavaScript Embedding API provides greater control over its functionality.

6.List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

- 1. Remove sensitive information: Exclude confidential data such as customer names, phone numbers, email addresses, and financial details before publishing the dashboard publicly.
- 2. Verify data permissions and anonymize data: Aggregate or anonymize personal information and check that the dashboard does not expose underlying data or downloadable details that should remain private.

- In short: Remove sensitive data and verify privacy settings before publishing a dashboard for public access.

7.After publishing a dashboard, users report a “Data not found” error. What is the most common cause related to data source setting

- The most common cause is an incorrect or inaccessible data source connection after publishing the dashboard.

For example, the published dashboard may reference a local Excel file or database that Tableau Server/Cloud cannot access, or the connection credentials may be missing or incorrect.

Solution:

- Verify that the published data source is available.
- Check the data source path and connection credentials.
- Ensure Tableau Server/Cloud has the required permissions to access the data source.

In short: The error usually occurs because Tableau Server/Cloud cannot locate or access the required data source.

8.When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content

- Two security measures should be implemented when embedding a Tableau dashboard into a secure internal portal:
- 1. User Authentication (SSO): Implement Single Sign-On (SSO) or another secure authentication method to verify users’ identities before granting access to the embedded dashboard.
- 2. Permission Controls and Row-Level Security (RLS): Configure Tableau permissions and row-level security so that only authorized users can view the dashboard and access the data relevant to their roles.
- In short: Use secure authentication to verify users and access controls to ensure they can view only the dashboards and data they are authorized to access.
